CLIENT:

NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

SUBJECT:

CALCULATION OF INTAKE/RISK FROM DERMAL CONTACT WITH GROUNDWATER
CHILD RESIDENTS

BASED ON:

USEPA, DECEMBER 1989, JULY 2004

BY:

R. JUPIN

CHECKED BY:

9/14/2012

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from dermal contact with

groundwater at former Building 234.

DAD = DAevent x EV x ED x EF x A
BW x AT

Where:

DAD = dermally absorbed dose (mg/kg/day)
DAevent = absorbed dose per event (mg/cm²/event)

EV = event frequency (events/day)
EF = exposure frequency (days/year)
ED = exposure duration (years)

A = skin surface available for contact (cm<sup>2</sup>)

BW = body weight (kg) AT = averaging time (days)

CSFd = dermal carcinogenic slope factor ((mg/kg/day)<sup>-1</sup>) RfDd = dermal noncarcinogenic reference dose (mg/kg/day)

**RISKS:** 

ILCR (Carcinogens) = DAD (mg/kg/day) x CSFd (mg/kg/day)-1 HQ (Noncarcinogens) = DAD (mg/kg/day) / RFDd (mg/kg/day)

## **EQUATIONS** for DAevent:

For Inorganics:

DAevent = Kp x Cw x CF x tevent

For Organics:

If tevent  $\leq$  t', then: DAevent=  $2 \times FA \times Kp \times Cw \times CF \times \sqrt{\frac{6 \times tau \times tevent}{\pi}}$ 

If tevent > t, then: DAevent=  $FA \times Kp \times Cw \times CF \times \left[ \frac{tevent}{1+B} + 2 \times tau \times \left( \frac{1+3B+3B^2}{(1+B)^2} \right) \right]$

SUBJECT:
ESTIMATION OF AMBIENT AIR CONCENTRATIONS IN A TRENCH RESULTING FROM VOLATILE EMISSIONS FROM GROUNDWATER.
BASED ON:
VDEQ, 2004
BY:
CHECKED BY:
R. JUPIN

JOB NUMBER:

112G02747

112G02747

STORM FROM VOLATILE EMISSIONS
FROM GROUNDWATER.

DATE:
9/14/2012

PURPOSE:

To calculate ambient air concentrations resulting from volatilization of TCE

from groundwater at former Building 234.

Ctrench = CGW x VF

Where:

Ctrench = concentration of contaminant in the trench μg/m<sup>3</sup>
CGW = concentration of contaminant in groundwater μg/L
VF = volatilization factor L/m<sup>3</sup>

## 1. Calculate kiG (gas-phase mass transfer coefficient of component i)

 $kiG = (MWH2O/MWi)^{0.335} \times (T/298)^{1.005} \times kG, H2O$ 

Where:

kiG = gas-phase mass transfer coefficient of component i cm/s

MW<sub>H2O</sub> = molecular weight of water =

18 g/mol

MW<sub>TCF</sub> = molecular weight of TCE =

131.39 g/mol

kG,H2O = gas-phase mass transfer coefficient of water vapor at 25°C cm/s =

0.833 cm/s

T = average system absolute temperature =

298

The value of kG, H<sub>2</sub>O is 0.833 cm/s (Superfund Exposure Assessment Manual, U. S. EPA, April 1988)

 $kiG = (18/131.39)^{0.335} x (298/298)^{1.005} x 0.833 cm/s = 4.28E-01 cm/s$ 

## 2. Calculate kil. (liquid-phase mass transfer coefficient of component i)

 $kiL = (MWO_2/MWi)^{0.5} x (T/298) x kL, O_2$ 

Where:

kiL = liquid-phase mass transfer coefficient of component i cm/s

 $MW_{O2}$  = molecular weight of  $O_2$  =

32 g/mol

MW<sub>TCF</sub> = molecular weight of TCE =

131.39 g/mol

T = average system absolute temperature =

298

kL, O<sub>2</sub> = liquid-phase mass transfer coefficient of oxygen at 25°C cm/s =

0.002 cm/s

 $kiL = (32/131.39)^{0.5} x (298/298) x 0.002 cm/s =$ 

9.87E-04 cm/s

CLIENT:		JOB NUMBER:

BY:	CHECKED BY:	DATE:
R. JUPIN	J. Cuy	9/14/2012

## 3. Calculate Ki (overall mass transfer coefficient of contaminant)

 $Ki = 1 / \{(1/kiL) + [(RT) / (Hi \times kiG)]\}$ 

Where:

kiL = liquid-phase mass transfer coefficient of i cm/s =9.87E-04R = ideal gas constant atm-m³/mole-°K =8.20E-05T = average system absolute temperature =298Hi = Henry's Law constant of TCE (atm-m³/mol) =9.85E-03KiG = gas-phase mass transfer coefficient of i cm/s4.28E-01

 $Ki = 1 / \{(1/9.87E-4) + [(298 \times 8.2E-5) / (9.85E-3 \times 0.428]\} =$ 

9.81E-04 cm/s

## 4. Calculation of VF (Volatilization Factor)

 $VF = (Ki \times A \times F \times 10^{-3} \times 10^{4} \times 3,600) / (ACH \times V)$ 

Where:

VF = volatilization factor (L/m<sup>3</sup>)

Ki = overall mass transfer coefficient of contaminant = 9.81E-04 cm/s

A = area of the trench = 8.18 m<sup>2</sup>

F = fraction of floor through which contaminant can enter (unitless) = 1

ACH = air changes per hour = 360 h<sup>-1</sup>

V = volume of trench = 24.92 m<sup>3</sup>

 $10^{-3}$  = conversion factor L/cm<sup>3</sup> 0.001  $10^4$  = conversion factor cm<sup>2</sup>/m<sup>2</sup> 10000 3,600 = conversion factor seconds/hr 3600

VF =  $(9.82E-4 \times 8.18 \times 1 \times 10^{-3} \times 10^{4} \times 3,600) / (360 \times 24.92) =$ 

3.22E-02 L/m<sup>3</sup>

## 5. Calculation of C<sub>trench</sub> (concentration of contaminant in the trench)

C<sub>trench</sub> = C<sub>GW</sub> x VF

Where:

C<sub>trench</sub> = concentration of contaminant in the trench (μg/m<sup>3</sup>)

C<sub>GW</sub> = concentration of TCE in groundwater =

3.9 μg/L

VF = volatilization factor =

3.22E-02 L/m<sup>3</sup>

 $C_{trench} = 3.9 \,\mu g/L \times 3.22 \text{E} - 02 \,L/\text{m}3 = 1.26 \text{E} - 01 \,\mu g/\text{m}^3$

CALCULATION OF INTAKE/RISK FRO	OM DERMAL CONTACT WITH SOIL	FOR MUTAGENIC CHEMICALS	
HYPOTHETICAL ADULT RESIDENTS	HYPOTHETICAL ADULT RESIDENTS		
BASED ON:			
USEPA, JULY 2004, MARCH 2005			
BY:	CHECKED BY:	DATE:	
R. JUPIN	L. Cufer	9/14/2012	

**PURPOSE:** To estimate intake and cancer risks for mutagenic chemicals from dermal contact with surface soil at former Building 234.

EQUATION: DEX = Cs x CF x SA x AF x ABS x EF x ED x ADAF

Where:

DEX = estimated exposure intake (mg/kg/day)
Cs = exposure point concentration in soil (mg/kg)

CF = conversion factor (1.0E-6 kg/mg)

SA = skin surface available for contact (cm²/day)

ABS = absorption factor (unitless)

AF = adherence factor (mg/cm²)

EF = exposure frequency (days/year)

ED = exposure duration (years)

BW = body weight (kg)
AT = averaging time (days)

ADAF = age-dependent adjustment factor

CSFd = dermal carcinogenic slope factor ((mg/kg/day)<sup>-1</sup>)

## RISKS:

ILCR (Carcinogens) = Intake (mg/kg/day) x CSFd (mg/kg/day)-1

7.1000.		-		
Cs	=	0.27	mg/kg	Chemical: Benzo(a)pyrene

## TABLE 3.1.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Current

Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of	Units	Arithmetic	95% UCL	Maximum Concentration			Exposure Point Concentration	
·	Potential Concern		Mean	(Distribution)	(Qualifier)	Value	Units	Statistic	Rationale
Unpaved	Aluminum	mg/kg	5260	6680 (L)	9650	6680	mg/kg	95% Modified-t UCL	ProUCL 4.1.01
North Waterfront	Arsenic	mg/kg	4.58	6.21 (N)	9.81	6.21	mg/kg	95% KM (t) UCL	ProUCL 4.1.01
Surface Soil	Manganese	mg/kg	171	229 (N)	337	229	mg/kg	95% Student's-t UCL	ProUCL 4.1.01

G = Gamma

L = Lognormal

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

# TABLE 3.2.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Future

Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of	Units	Arithmetic	95% UCL	Maximum Concentration	<u> </u>		Exposure Point Concentration	
	Potential Concern		Mean	(Distribution)	(Qualifier)	Value	Units	Statistic	Rationale
North Waterfront	Aluminum	mg/kg	5690	6470 (G)	9650	6470	mg/kg	95% Approximate Gamma UCL	ProUCL 4.1.01
	Arsenic	mg/kg	4.86	5.76 (G)	10.9	5.76	mg/kg	95% KM (BCA) UCL	ProUCL 4.1.01
	Manganese	mg/kg	211	255 (G)	340	255	mg/kg	95% Approximate Gamma UCL	ProUCL 4.1.01

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

## TABLE 3.3.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Future Medium: Subsurface Soil

Exposure Medium: Subsurface Soil

Exposure Point	Chemical of	Units	Arithmetic	95% UCL	Maximum Concentration			Exposure Point Concentration	
	Potential Concern		Mean	(Distribution)	(Qualifier)	Value	Units	Statistic	Rationale
North Waterfront	Arsenic	mg/kg	6.1	7.0 (NP)	16.6	7.0	mg/kg	95% Student's-t UCL	ProUCL 4.1.01
	Manganese	mg/kg	210	248 (G)	549	248	mg/kg	95% Approximate Gamma UCL	ProUCL 4.1.01

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

## TABLE 3.4.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Current

Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
Unpaved Central Shipyard	Aluminum	mg/kg	(1)	(1)	13,100	13,100	mg/kg	Maximum Detected Concentration	(1)

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

(1) There are less than five samples. Pro UCL will not calculate any statistics with less than five samples. Maximum Concentration is used for the EPC.

# TABLE 3.5.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Future Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
Cental Shipyard	Aluminum	mg/kg	10,900	13,400 (N)	13,200	13,200	mg/kg	Maximum	(1)

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

(1) Calculated 95% UCL exceeds the maximum concentration. Maximum concentration used as the EPC.

## TABLE 3.6.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Future Medium: Subsurface Soil

Exposure Medium: Subsurface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
Cental Shipyard	Manganese	mg/kg	336	382 (N)	612	382	mg/kg	95% Student's-t UCL	ProUCL 4.1.01

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

### TABLE 3.7.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Current

Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of	Units	Arithmetic	95% UCL	Maximum Concentration			Exposure Point Concentration	
	Potential Concern		Mean	(Distribution)	(Qualifier)	Value	Units	Statistic	Rationale
1									
Unpaved Building 234	Aluminum	mg/kg	7570	10200 (N)	11300	10200	mg/kg	95% Student's-t UCL	ProUCL 4.1.01

G = Gamma

N = Normal

NP = Non-parametric

1 There are less than four detected concentrations. Reliable statistics cannot be computed. The Maximum concentration was used as the EPC.

2 - Mean concentration is used as exposure point concentration for evaluating exposures to lead.

U.S. EPA, 1994:Guidance Manual for the Integrated Exposure Uptake Biokinetic Model for lead in Children.

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

### TABLE 3.8.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Future Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
Building 234	Aluminum	mg/kg	7360	9570 (N)	11300	9570	mg/kg	95% Student's-t UCL	ProUCL 4.1.01

G = Gamma

N = Normal

NP = Non-parametric

- 1 There are less than four detected concentrations. Reliable statistics cannot be computed. The Maximum concentration was used as the EPC.
- 2 The calculated 95% UCL exceeds the maximum concentration. The maximum concentration was used as the EPC.
- 3 Mean concentration is used as exposure point concentration for evaluating exposures to lead.
- U.S. EPA, 1994:Guidance Manual for the Integrated Exposure Uptake Biokinetic Model for lead in Children.

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

## TABLE 3.9.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Current Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
Unpaved PCB	Aluminum	mg/kg	(1)	(1)	12,300	12,300	mg/kg	Maximum Detected Concentration	(1)
Removal Area	Chromium	mg/kg	(1)	(1)	15.8 J	15.8	mg/kg	Maximum Detected Concentration	(1)

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

(1) There are less than five samples. Pro UCL will not calculate any statistics with less than five samples. Maximum Concentration is used for the EPC.

### TABLE 3.10.RME EXPOSURE POINT CONCENTRATION SUMMARY REASONABLE MAXIMUM EXPOSURE FORMER ROBERT E. DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Future Medium: Surface Soil

Exposure Medium: Surface Soil

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
PCB Removal Area	Aluminum	mg/kg	(1)	(1)	12,300	12,300	mg/kg	Maximum Detected Concentration	(1)
	Chromium	mg/kg	(1)	(1)	15.8 J	15.8	mg/kg	Maximum Detected Concentration	(1)

G = Gamma

N = Normal

NP = Non-parametric

Exposure point concentrations for the RME scenarios are also the exposure point concentrations for the CTE scenarios.

- (1) There are less than five samples. Pro UCL will not calculate any statistics with less than five samples. Maximum Concentration is used for the EPC.
- (2) There are less than four detected concentrations. Reliable statistics cannot be computed. The Maximum concentration was used as the EPC.

# APPENDIX G BACKGROUND ANALYSIS

### **Background Evaluation**

Based on comments received from EPA and RIDEM and the discussions at the March 2012 RPM meeting, Navy utilized the NAVSTA Newport Basewide Background Study to establish a background dataset for metals in soil that were determined to be risk drivers or considered background based on the previous geochemical analysis that was conducted. Navy used the ProUCL software program to calculate the Upper Predictive Limit to be used as a background threshold value (BTV) for Site 19 – On-Shore Derecktor Shipyard.

The EPA ProUCL Fact Sheet

(http://www.epa.gov/nerlesd1/tsc/ProUCL\_v4.00.05/ProUCL\_v4.0\_Facts\_Sheet.pdf) states:

ProUCL 4.0 can be used to compute several parametric and nonparametric upper limits that are used to estimate the BTVs or not-to-exceed values for data sets with NDs and without NDs. These upper limits include: upper prediction limits (UPLs), upper tolerance limits (UTLs), and upper percentiles. Some of the nonparametric methods such as the Kaplan-Meier (Meier, 1958) method and ROS methods are applicable on left-censored data sets having multiple detection limits. The background statistics as incorporated in ProUCL 4.0 are particularly useful when individual site observations from some impacted site areas (perhaps after some remediation activities) are to be compared with BTVs to determine if adequate amount of remediation and cleanup has been performed yielding remediated site concentrations comparable to background level concentrations; that is if the site concentrations can be considered as coming from (or approaching to) the population of background concentrations.

Navy will calculated UPLs from the base background dataset for all surface and subsurface soil types. The soil types were combined because the soil type at Site 19 is classified as urban fill and is likely a combination of different soil types from other portions of NAVSTA Newport. Table 1 presents the calculated UPL values for metals that were determined to be risk drivers or were considered within background levels by the geochemical analysis and the ProUCL output file.

In response to Navy's suggestion to use UPLs to establish background values, RIDEM requested that the arsenic values be adjusted. Based on RIDEM's evaluation of the background data for arsenic using the ProUCL software program, RIDEM requested that the Navy revise the UPLs for arsenic in the SASE Addendum to 13 mg/kg for surface soils and 20 mg/kg for subsurface soils. In surface soils, both Beach and Stissing Silt Loam were determined to be unrepresentative soil types for site-wide soil conditions. Beach soils were considered unrepresentative because concentrations of aluminum, arsenic, chromium, and cobalt were many times lower than concentrations observed in all other soil types. Stissing silt loam was considered unrepresentative due to elevated concentrations of arsenic, chromium, cobalt, and iron, as compared to other soil types. Several of these elevated concentrations were also determined to be outliers. Therefore, the value of 13 mg/kg for surface soil was calculated by eliminating Beach (Ba) and Stissing Silt Loam (Se) soils from the input to ProUCL.

In subsurface soils, Mansfield Mucky Silt Loam and Stissing Silt Loam were determined to be unrepresentative of site-wide soil conditions due to elevated concentrations of arsenic and cobalt, as compared to concentrations observed in other soil types. Therefore, the 20 mg/kg result for subsurface soils was determined by excluding the Mansfield Mucky Silt Loam (Ma) and Stissing Silt Loam (Se) background data. The following tables contain summary statistics for each of the soil types in the base backgorund dataset.

### SURFACE SOIL

Soil Type	Navy Proposed	Outlier Values	With (mg/kg		Outliers	Withou (mg/kg		Outliers
<i>,</i>	UPL (mg/kg)	(mg/kg)	Mea n	Max	UPL	Mea n	Max	UPL
All soils	18	71.7; 23.5; 22.5	7.07	71.7	17.7	6.21	17.1	14.7
All except Beach and Stissing Silt Loam	18	22.5	6.59	22.5	13.9	6.39	17.1	13.2
Beach soils	18	none	1	1.3	1.29	1.00	1.3	1.29
Mansfield Mucky Silt Loam	18	22.5	7.05	22.5 0	16	6.24	13	12
Merrimack sandy loam	18	none	4.03	6	6.05	4.03	6	6.05
Newport silt loam	18	none	6.28	17.1	16.7	6.3	17.1	16.7
Pittstown silt loam	18	none	9.04	15	14.5	9.0	15	14.5
Stissing silt loam	18	71.7; 23.5	13	72	69.3	9.16	16.3	15.2

### SUBSURFACE SOIL

Soil Type	Navy Proposed	Outlier Values	With (mg/kg		Outliers		Without Outlie (mg/kg)		
,,	(mg/kg)	(mg/kg)	Mea n	Max	UPL	Mea n	Max	UPL	
All soils	29	42.6; 38.7; 37.9	10.9	42.6	27.2	9.97	28.9	23.7	
All except Mansfield and Stissing silt loams	29	none	7.87	23.5	20.5	7.9	23.5	20.5	
Mansfield Mucky Silt Loam	29	none	16.5	42.6	37.8	16.5	42.6	37.8	
Merrimack sandy loam	29	none	4	6.7	5.65	4	6.7	5.65	
Newport silt loam	29	17.7	4.36	17.7	9.28	3.69	5.8	6.44	
Pittstown silt loam	29	none	14.2	23.5	22.8	14.2	23.5	22.8	
Stissing silt loam	29	none	16.4	27.3	31.4	16.4	27.3	31.4	

RIDEM suggested that the Navy use UPLs of 13 mg/kg for surface soil and 20 mg/kg for subsurface soil for arsenic in the Draft Final SASE Addendum. Navy agreed with RIDEM's suggestion

## APPENDIX H FORMER USMC TRAILER LOCATION, FINAL SITE CLEANUP

### 04 June 2012

Former USMC Trailer Location, Coddington Cove Naval Station Newport Final Site Clean Up

### Clean Up Requirements

Final Clean Up requirements are based on inspection observations.

The intent of this document is to serve as the basis in developing a Statement of Work for a Design Build Contract for a project to execute the required final cleanup of the site.

### Site Information/Background:

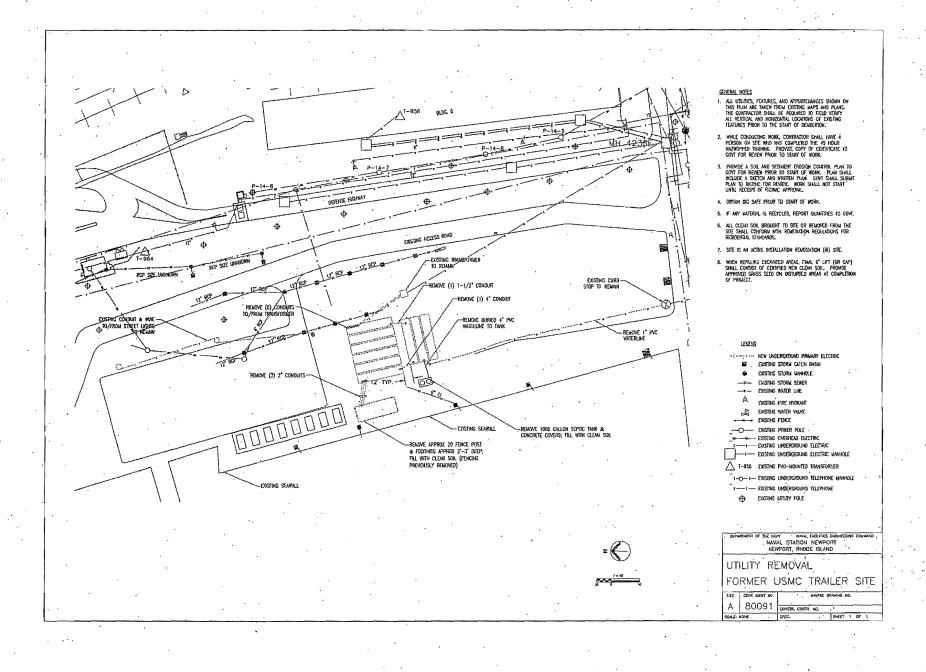

- 1. Site is an active Installation Remediation (IR) site.
- 2. Approx 3 years ago (Summer 2009), site had 2 feet of clean soil put down on the top of the site from another construction site on the installation
- 3. The site was then used for 2 years by the USMC, whereupon approximately 9 trailers were located and a parking lot of crushed stone were constructed.

### Clean Up requirements include:

- 1. Remove abandoned buried electrical conduits, water line, septic tank and piping, and fence posts.
- 2. While conducting work, contractor shall have a person on site full time who has completed the 40 hour Hazwopper training. Provide copy of certificate to Govt for review prior to start of work.
- Prior to start of work, provide a soil and sediment erosion control plan to Govt for review prior to start of work. Plan shall include a sketch and written plan. Govt shall submit plan to RI-CRMC for review. Work shall not start until receipt of RI-CRMC approval.
- 4. Obtain Dig Safe prior to start of work.
- 5. If any material is recycled, report quantities to Govt.
- 6. All clean soil brought to site or removed from the site shall conform with Remediation Regulations for Residential standards.
- 7. When refilling excavated areas, final 6" lift (or cap) shall consist of certified new clean soil.
- 8. Provide approved grass seed on disturbed areas at completion of project.

Refer to Sketch for approximate locations, quantities and sizes.

Cost Estimate - The Government Estimate is attached.
